How to make a PDF

- Start a local server.
    - navigate to this folder in the terminal
    - run **`python3 -m http.server 8000`**
        - leave that terminal window open.
        - (Python should be installed on your Mac…)
- Run the page though princeXML
    - download and install PrinceXML. demo version works great, you just have a watermark.
        - `https://www.princexml.com/download/`
    - run **`prince -j http://127.0.0.1:8000 -o test.pdf`**

Pro tips:

- up-arrow key in terminal re-runs last command. so in that Prince terminal window, you can just hit UP and Return to make a new PDF if you changed anything in the document/script.
- if you leave the PDF file open in Preview.app, it will update every time you generate a PDF, if you're making adjustments and regenerating and faffing about. It's just like old-school web dev when you get to refresh the browser to see what you did!

Test Content – Oblique Strategies

- A line has two sides
- Abandon desire
- Abandon normal instructions
- Accept advice
- Accretion
- Adding on
- Allow an easement (an easement is the abandon of a stricture)
- Always first steps
- Are there sections?
  Consider transitions
- Ask people to work against their better judgement
- Ask your body
